

Layering, Stacks, Protocols

Ramona Marfievici
[\(ramona.marfievici@cit.ie\)](mailto:ramona.marfievici@cit.ie)

Introduction

Internet Of Things

- A set of interconnected computing devices
 - Autonomous coordinate
 - Acquire data (sensors) and operate (actuators) in the physical world
 - Are seamlessly integrated with
 - information systems
 - Internet

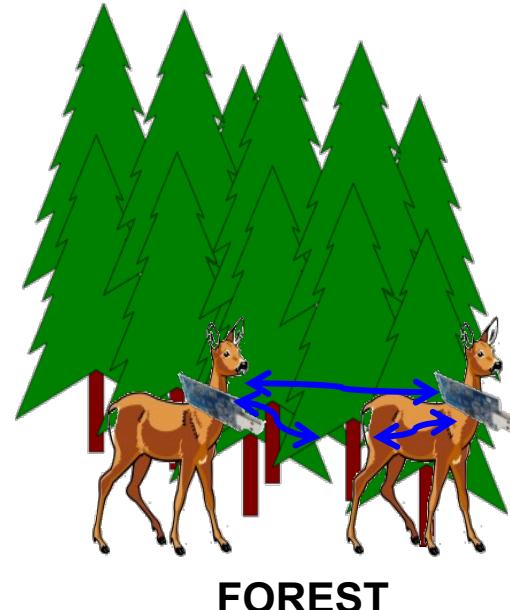

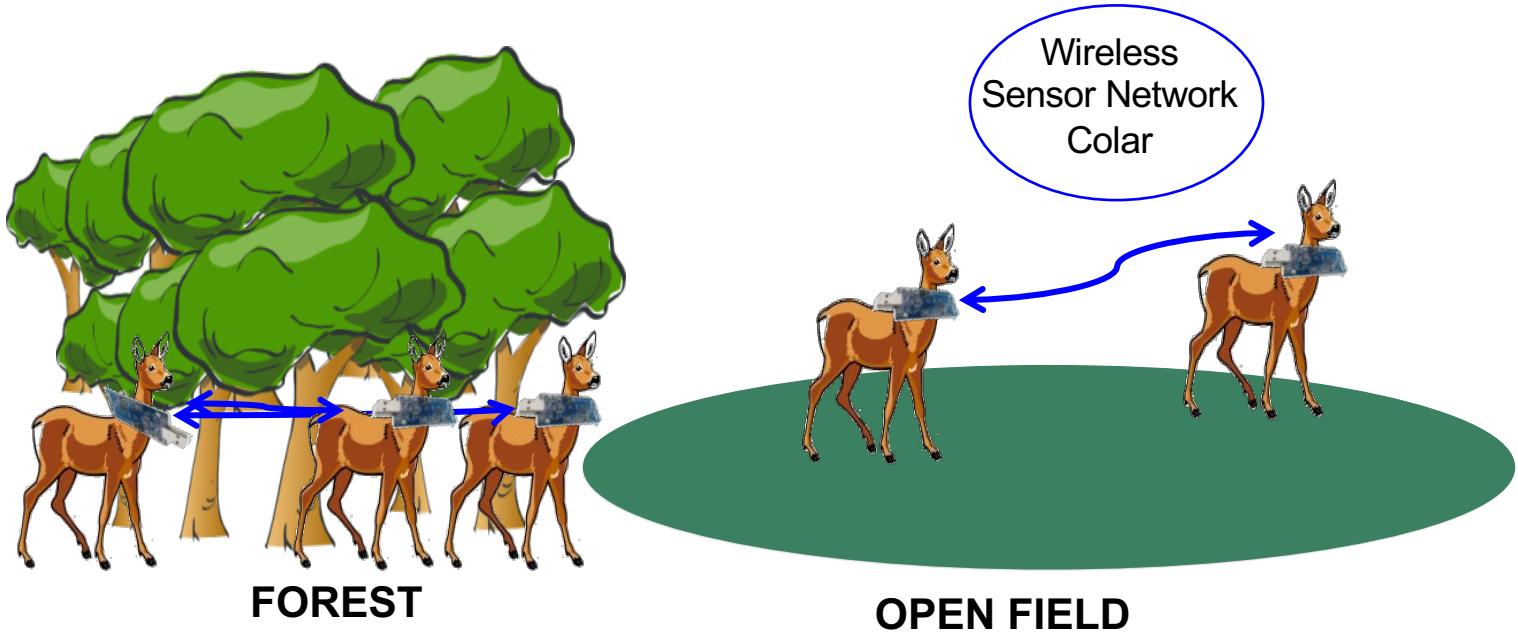

How to connect Things

- How can they talk to each other? (interconnecting)
- How they can be part of the WWW?

How to connect Things?

Biologist

Detour...

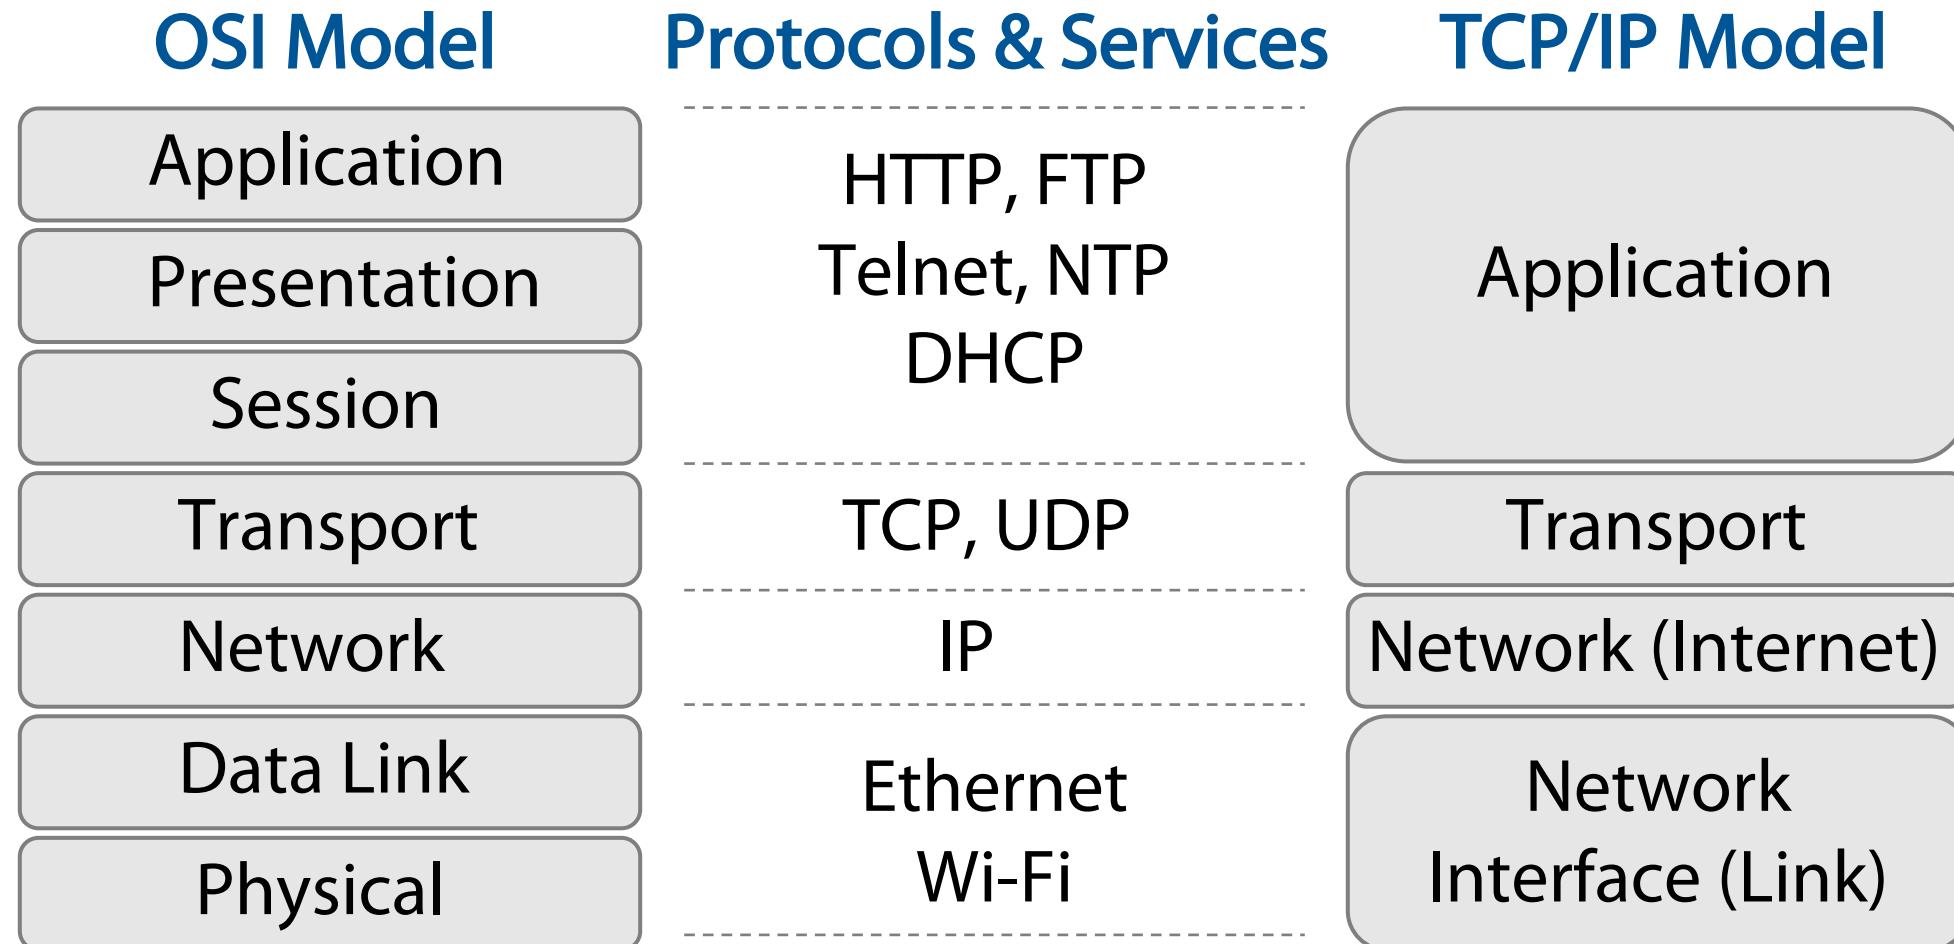

Layering

- Fundamental abstraction of systems, models, communication networks

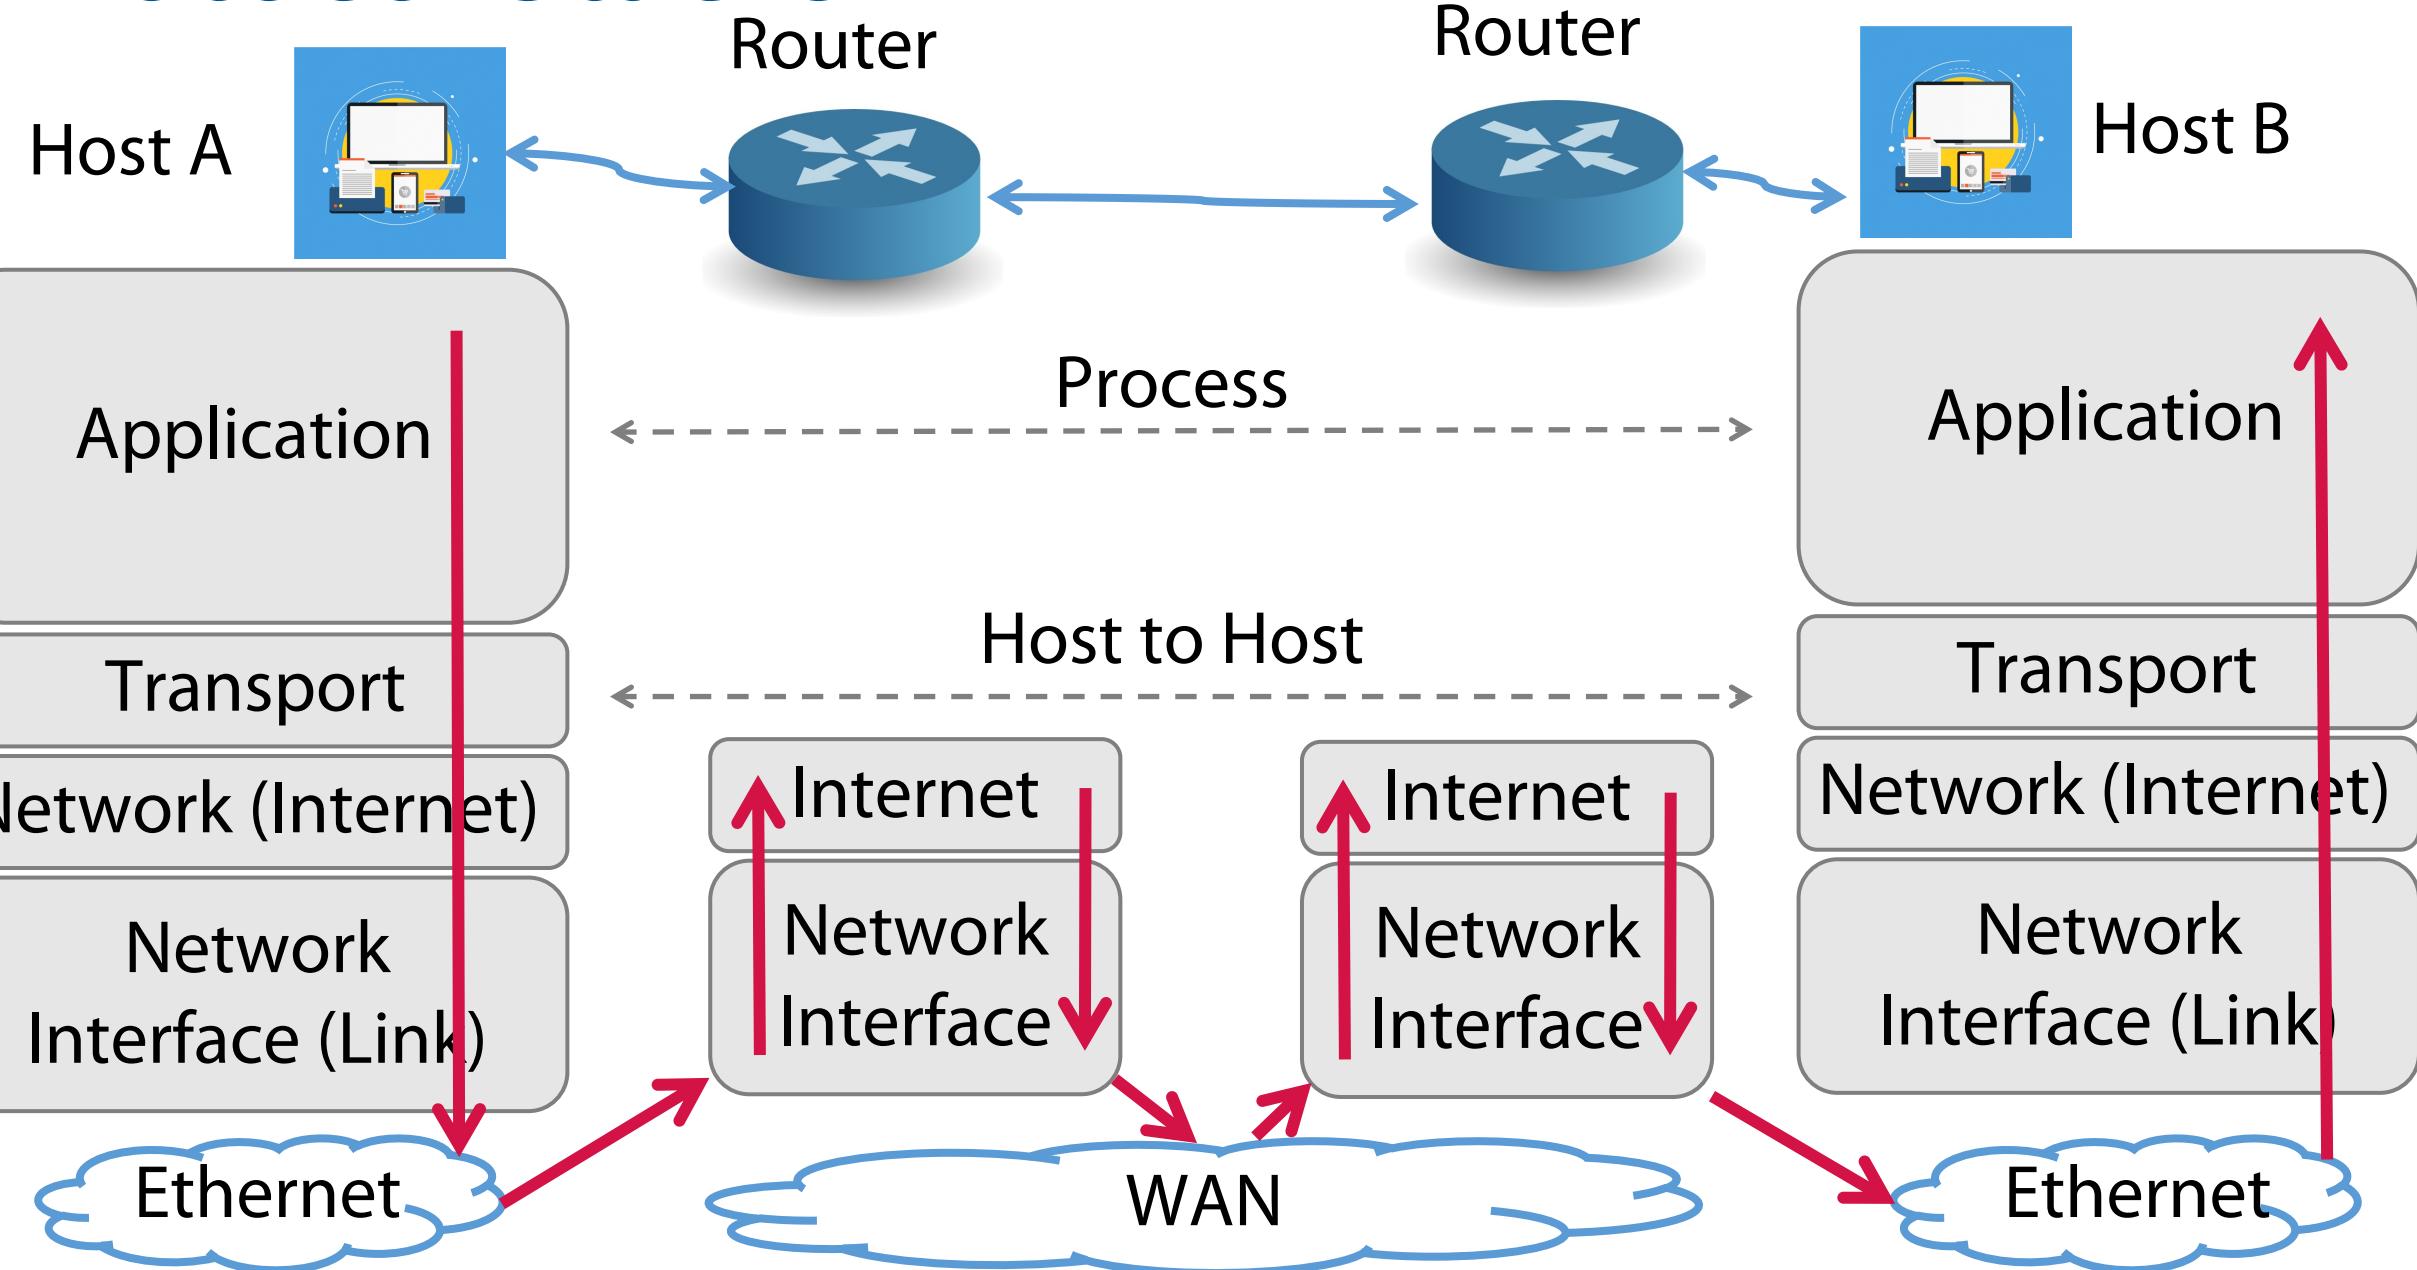

Separation of Concerns (SoC)

- Solving different issues separately is a *Good Idea*
- Complex solutions need a structured approach for solving them
 - Solutions become easier to create
 - Parts of solutions may become reusable
 - Parts of solutions may become replaceable
- Is a good idea but not without costs
 - “vertical integration” allows optimizations not possible in structured design
 - “design depends largely on constraints” (Charles and Ray Eames)

Protocol Stacks

Protocol Stacks

Protocol Stacks

Network

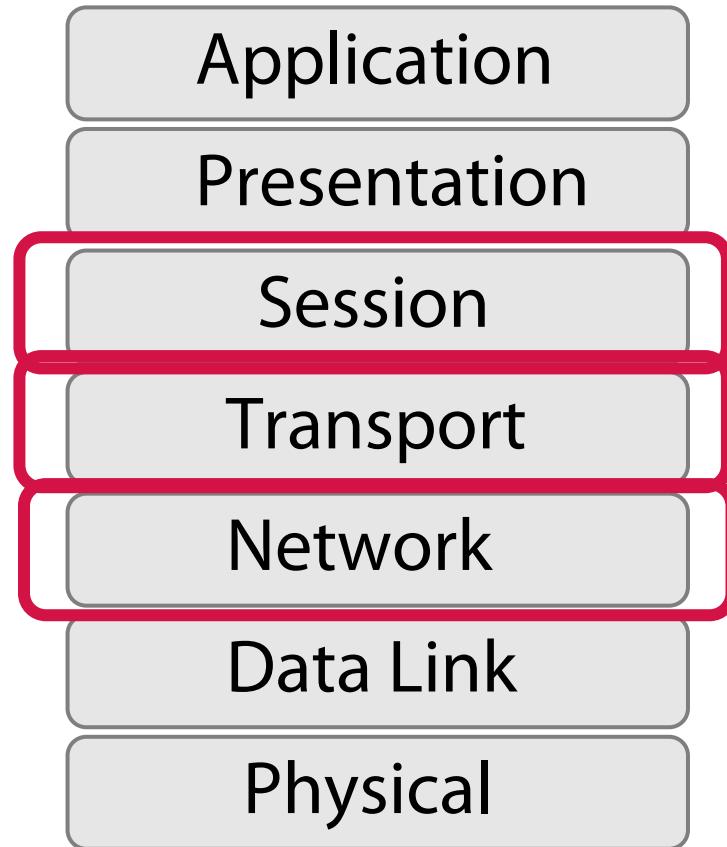

- Allows addressing
- TCP/IP stack: IP addressing

Transport

- Process to process connectivity
- TCP/IP stack: host to host connectivity

Session

- Apps should be able to start/pause/restart and end sessions
- Can be terrible for scalability: creating tight coupling between two processes
- REST tries really hard to build a session-free web (“stateless interactions”)

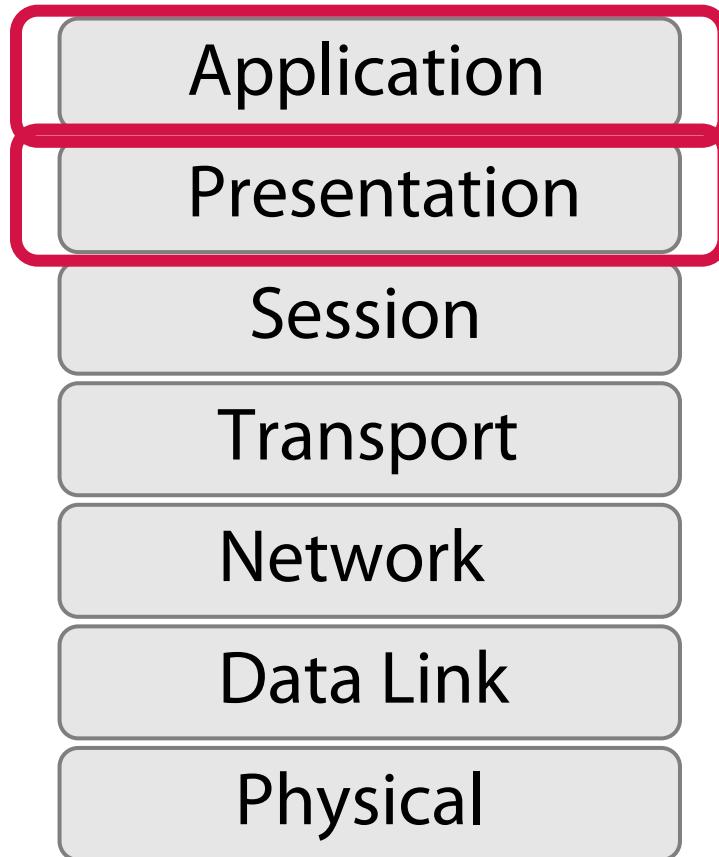

Protocol Stacks

Presentation

- Internet has media types & same “generic” data representation languages (e.g., XML, JSON, RDF)

Application

- Anything that is built on top of the network stack
- Can select (some of the) aspects of the stack
 - TCP: reliable and flow-controlled
 - UDP: both for real-time & loss tolerant data
- **Lower layers are completely invisible to applications**
- Complete abstraction is a dream, complete control is a nightmare
 - Or is it the other way around? It all depends on the scenarios
 - Internet and apps evolve, protocols evolve and features evolve

So/Too Many Protocols

Protocols/standards necessarily a tradeoff

- Dedicated solutions can be more specialized/optimized
- Generalized solutions have advantages of reuse/interoperability

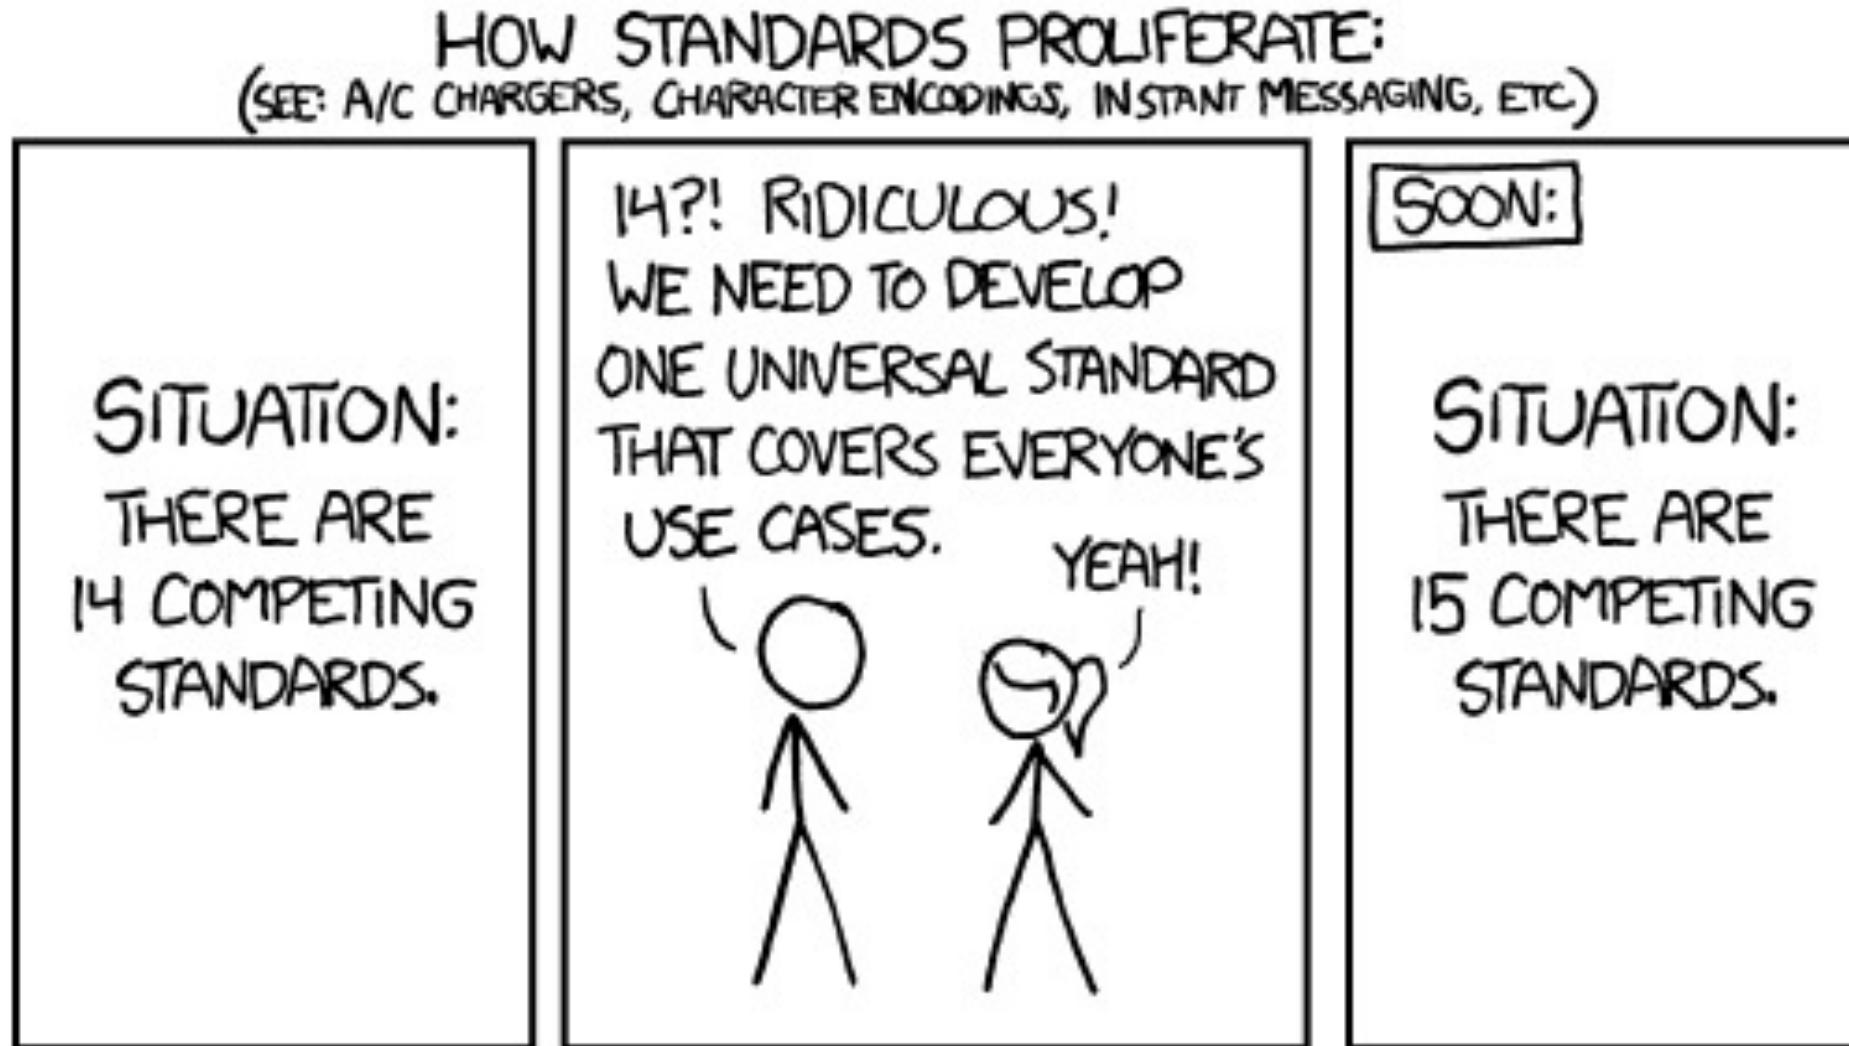

Even “the Internet” was the only solution initially

- OSI was developed as an alternative
- TCP/IP won ad today is **the only** connectivity layer in most scenarios

As new scenarios emerge, the landscape evolves

- Eventually, very few proven solutions become (de-facto) standards

Creating the Silver Unicorn Hammer

Why is the IoT Different?

- Low-cost tiny devices
 - Limited resources (computing, memory, storage)
 - Energy constraints
- } Device level
- Large scale networks
 - Individual addressing of the nodes
 - Amount of generated data
 - Lossy environments
- } Network level
- Diverse requirements/technologies
 - Maintenance
 - Evolvability, extensibility
- } Non-technical challenges

Why is the IoT Different?

- Spectrum availability & interference
 - Limited unlicensed spectrum
 - Shared medium
- Wireless devices co-existence problems
 - Wi-Fi, wireless sensor networks
- Power and energy management
 - Low power wireless, energy harvesting
- Addressing
- Data rates & volumes
 - Devices with different data rates
 - Where to store and process (in-network, edge, cloud?)

Why is the IoT Different?

- Privacy and security
- Dense networks
 - Excessive collisions => delays/data loss
 - Challenges: protocol design

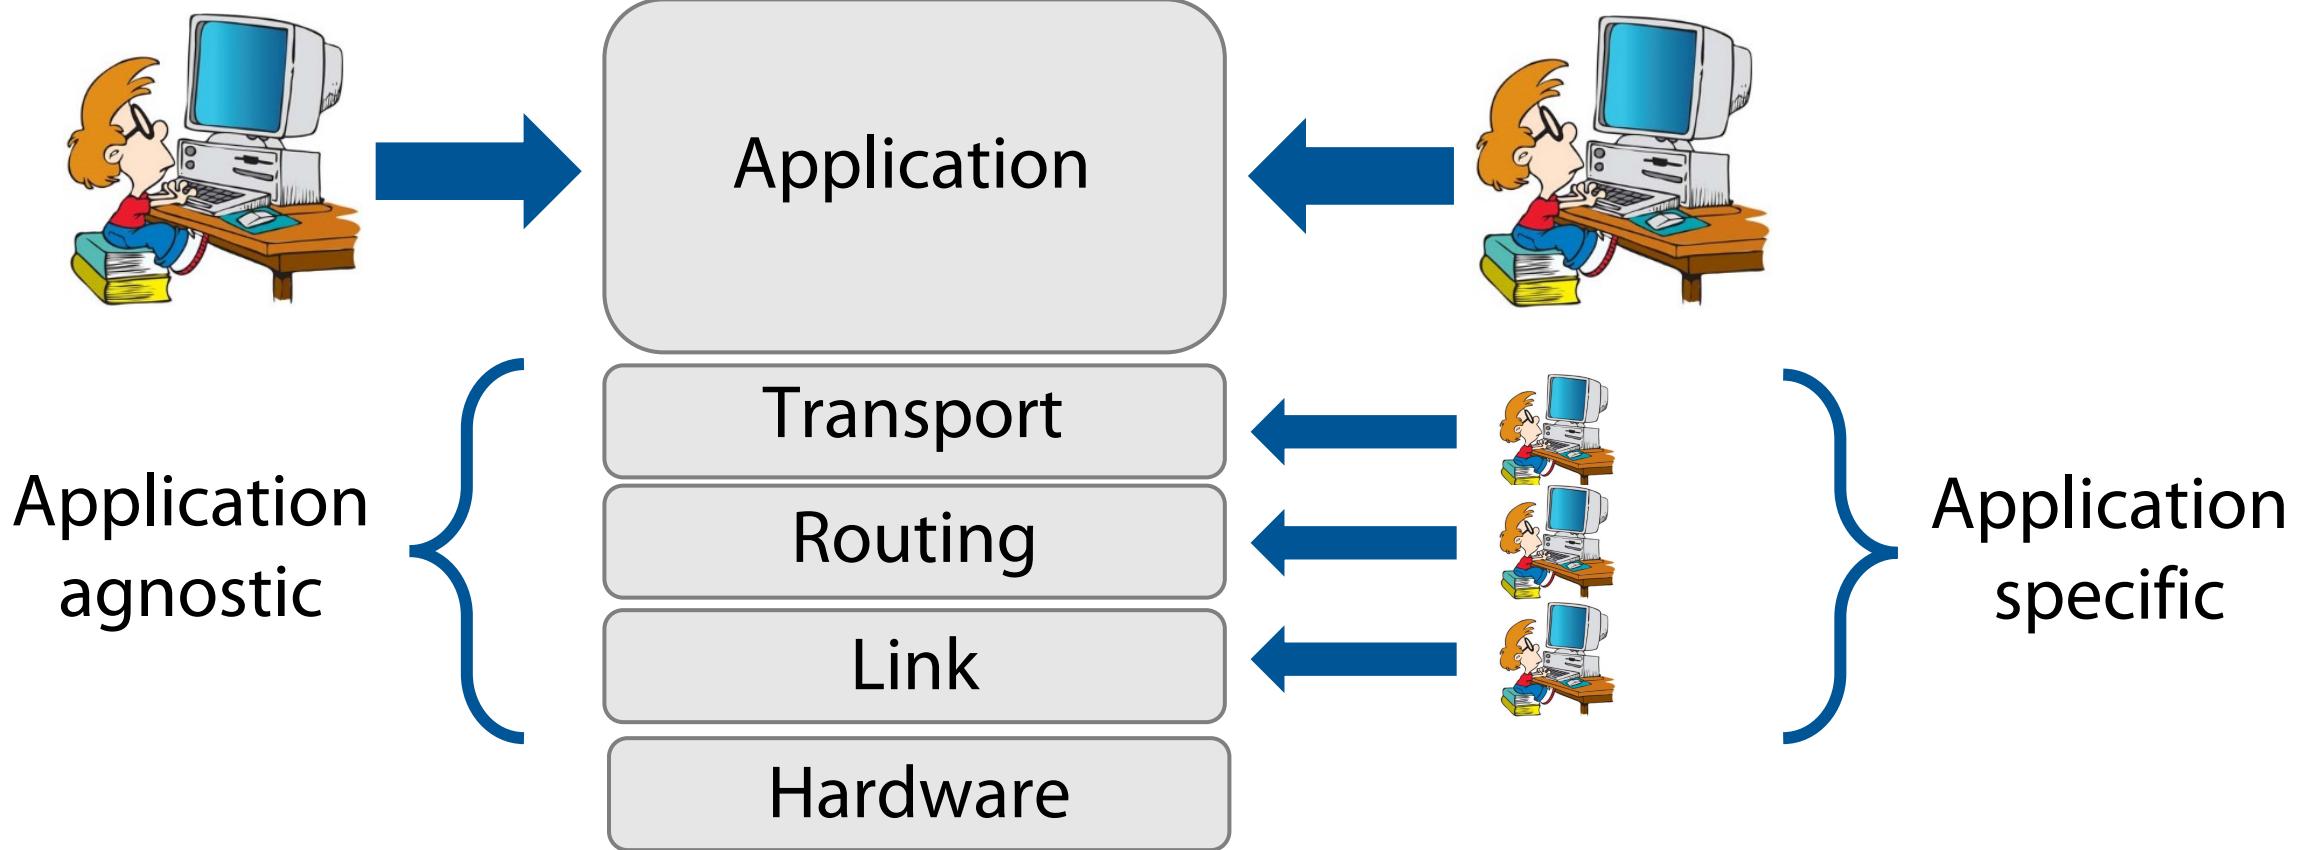

Infrastructure is different
with different constraints!!!

Towards the Real IoT

- Writing IoT applications requires understanding the **constraints**
- Above all, the **network** effect is what matters
- Design of new protocols required
 - Unique characteristics
 - Different requirements

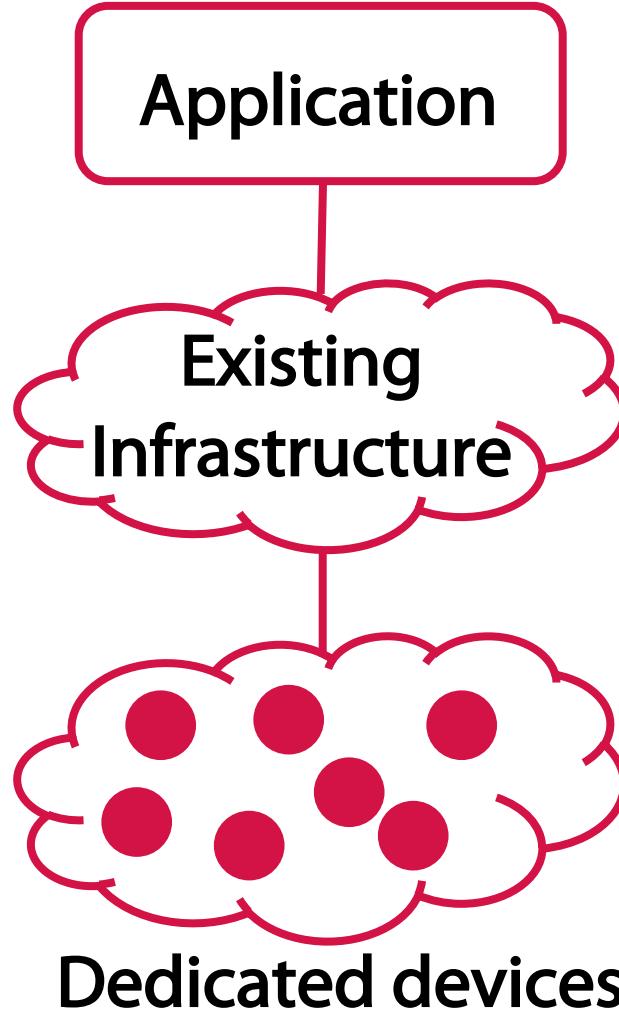

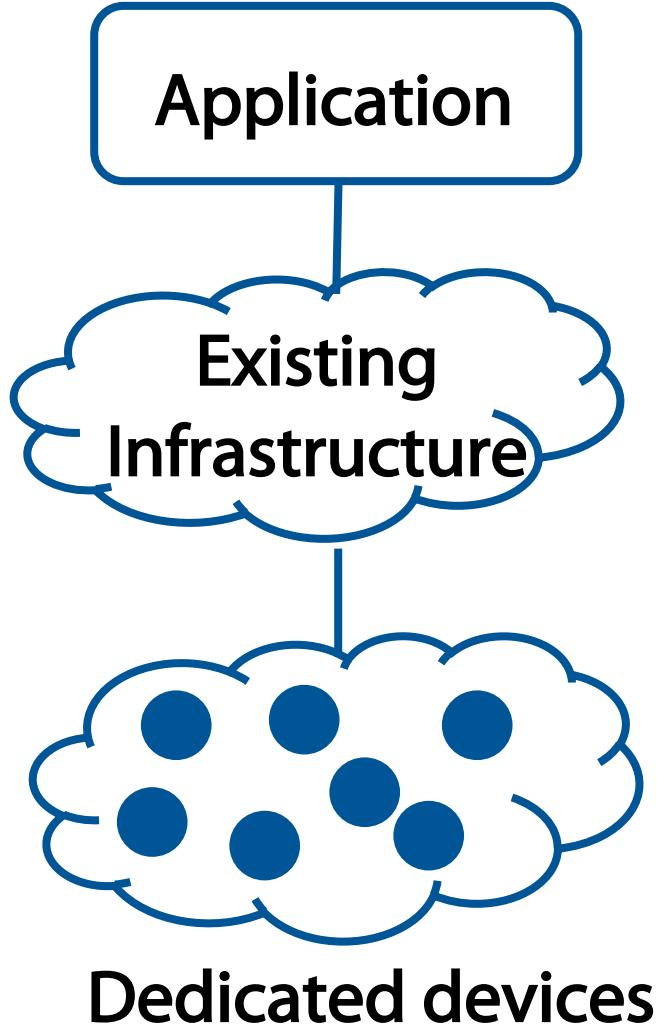

Towards the Real IoT

Conventional
systems

Towards the Real IoT

Many “vertical” solutions: interaction with devices via proprietary systems

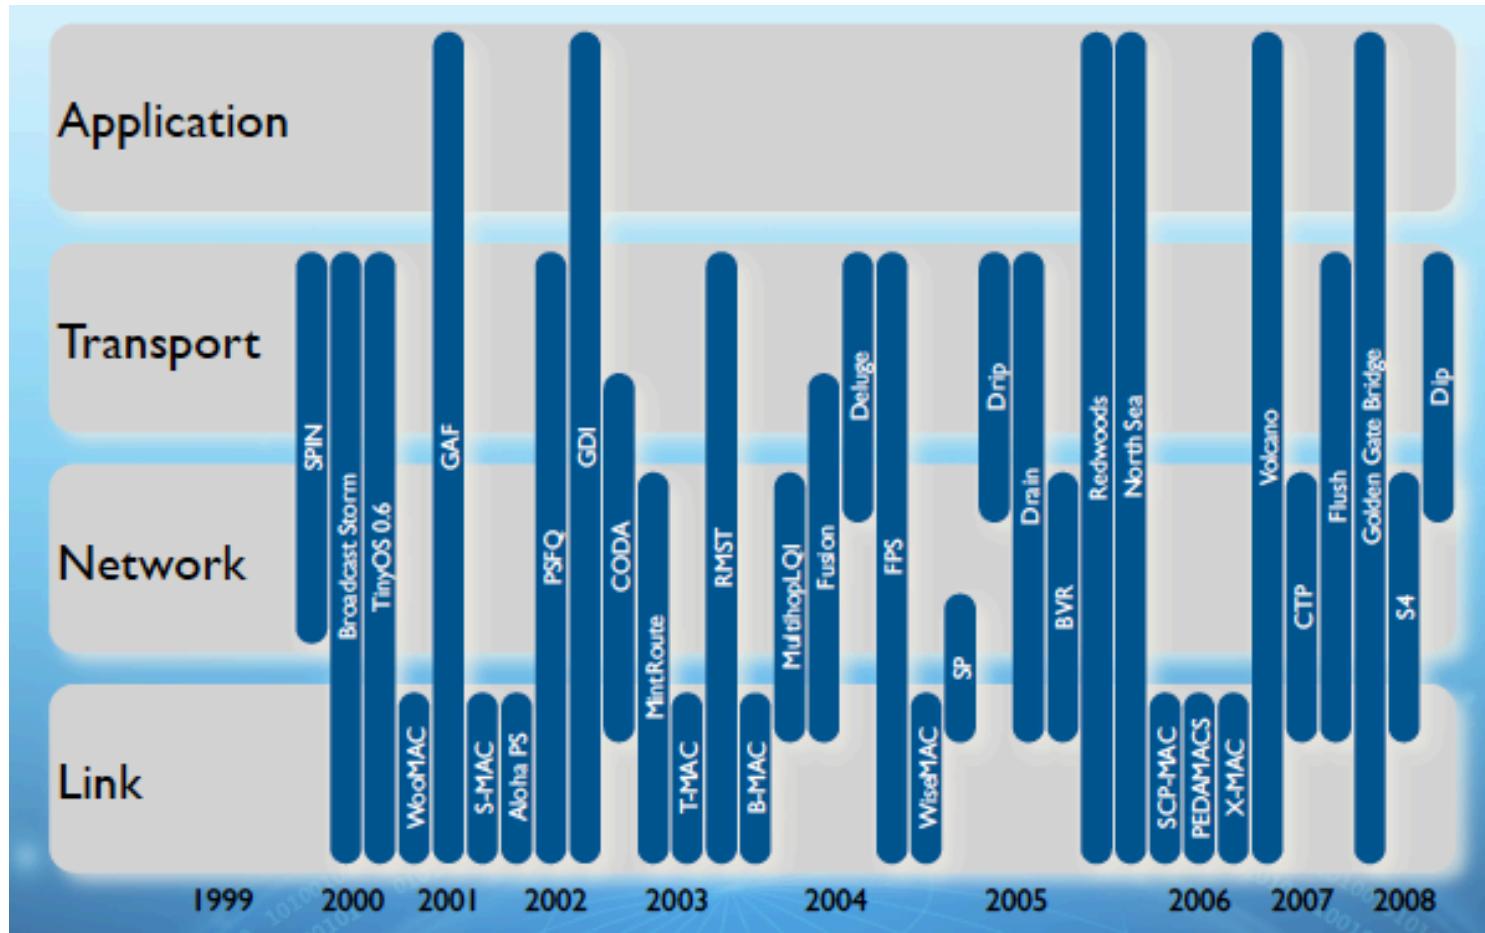

- Highly optimized!
- Operate in isolation
- Inefficient
- Do not scale well

Towards the Real IoT

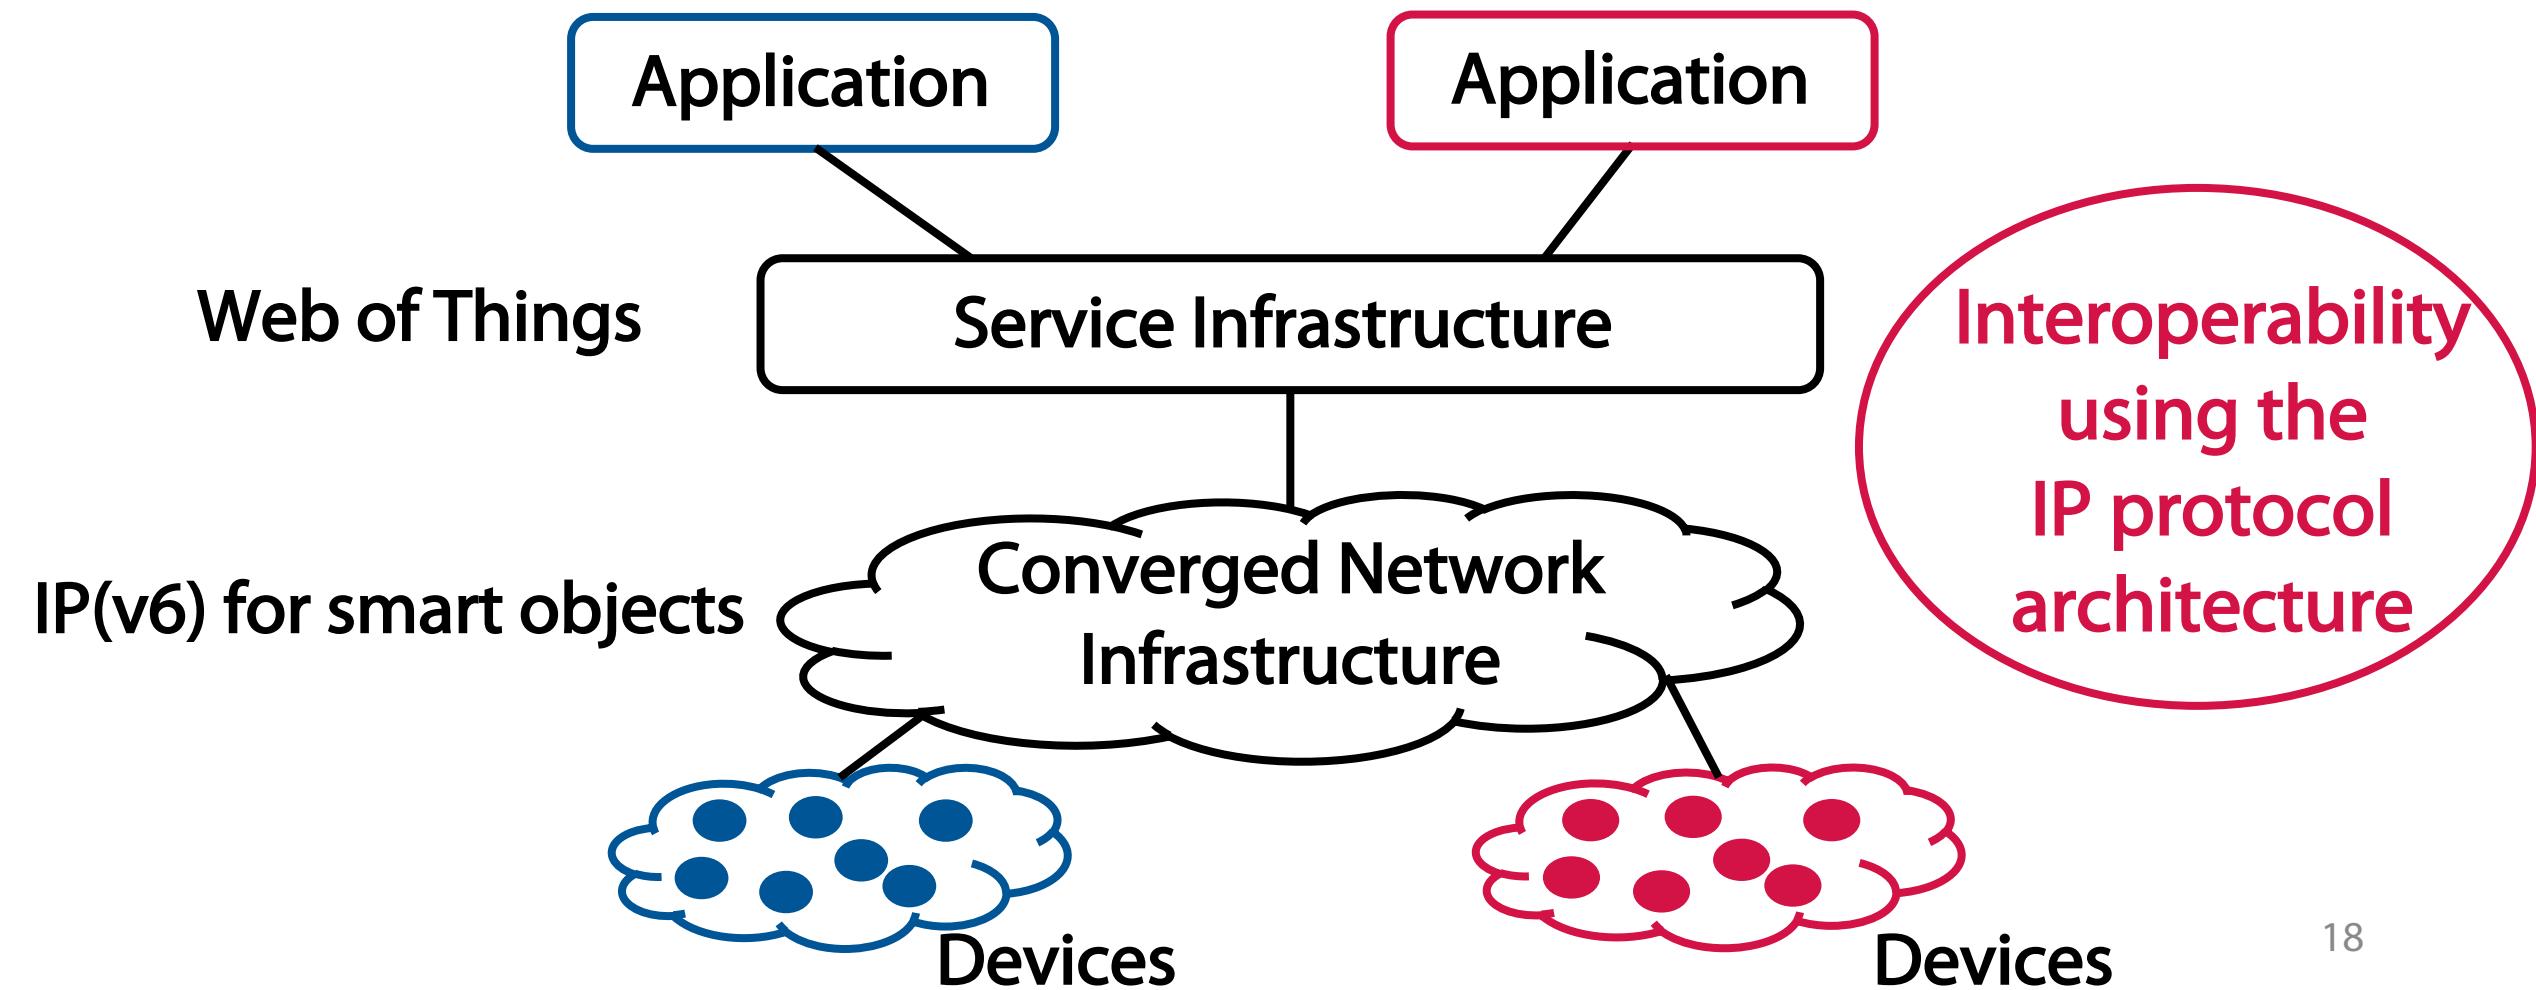

Initially, the community rejected the IP architecture

- “Resource constraints may cause us to give up the layered architecture”
- “It is reasonable to assume that networks can be tailored to the applications at hand”

Towards the Real IoT

Community converging to distributed intelligence & actions across standardized networks and interfaces

Converging to the IP Architecture

The diagram illustrates the convergence of various network technologies to an IP architecture. It shows a user connecting to a service provider, which then connects to cloud services. Inside a house, DECT technology connects to wireless nodes like a lamp and a mouse, which are also connected to gateways and middleware.

Transmission of IPv6 over DECT Ultra Low Energy (highlighted with a red box)

Converging to the IP Architecture

The image is a collage of various components and screenshots related to Bluetooth Low Energy (BLE) and its integration with IPv6 mesh networking.

Top Left: A close-up of a BLE module with a black omnidirectional antenna attached via a SMA connector.

Top Center: The Bluetooth logo with the text "Bluetooth® LOW ENERGY (4.0) / SMART". Below it are icons for Apple and Android.

Top Right: A screenshot of a laptop's file explorer showing images of BLE modules. One module is labeled "bluegiga BLE112". Another module is labeled "Zigbee 3.0 802.15.4 2.4GHz 2.4GHz 2.4GHz 06ACB2".

Bottom Left: A screenshot of the IETF website's document search results. A red arrow points from the "Low-power" section of the search results to the "IPv6 Mesh over BLUETOOTH(R) Low Energy using IPSP" document.

Bottom Center: A table of I-D documents:

Date	Status	Pages	WG Document	Author
2016-11-13	I-D Exists	17 pages	WG Document	
2017-01-11	I-D Exists	29 pages	WG Document	Samita Chakrabarti
2016-11-13	I-D Exists	10 pages	WG Document	
2016-12-15	RFC Ed Queue : EDIT for 10 days	22 pages	Submitted to IESG for Publication: Proposed Standard	Suresh Krishnan
			Reviews: genart, intdir, opsdir, secdir	Samita Chakrabarti
			Mar 2015	

Bottom Left Labels: draft-ietf-6lo-backbone-router-03, IPv6 Backbone Router, draft-ietf-6lo-blemesh-00, IPv6 Mesh over BLUETOOTH(R) Low Energy using IPSP, draft-ietf-6lo-dect-ule-09, Transmission of IPv6 Packets over DECT Ultra Low Energy.
